

WEBSITE ACCESS SETUP

Objective:

The objective of this task is to configure a web server and DNS service so that all users in the network can access the company website using a domain name.

Web Server Configuration:

The web server was configured using the existing server in the network.

Steps performed:

- Opened Server0 then Services then HTTP
- Enabled the following services:

HTTP: ON

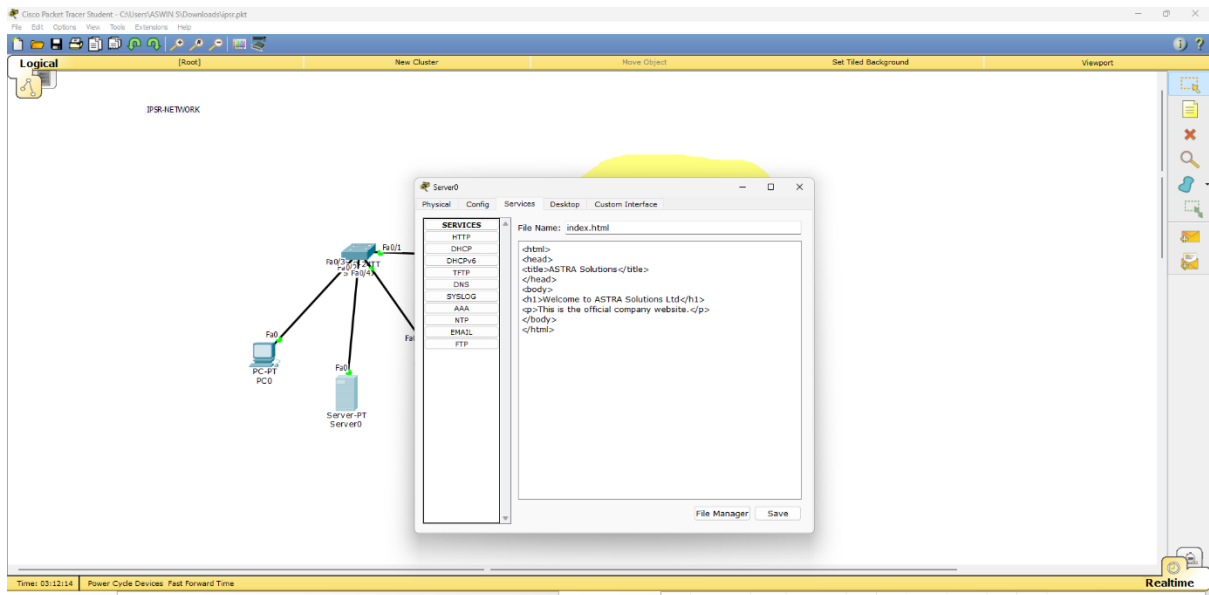

HTTPS: ON

Web Page Creation:

The index.html was edited to display company information.

HTML Code Used:

```
<html>
<head>
<title>ASTRA Solutions</title>
</head>
<body>
<h1>Welcome to ASTRA Solutions Ltd</h1>
<p>This is the official company website.</p>
</body>
</html>
```

DNS Configuration:

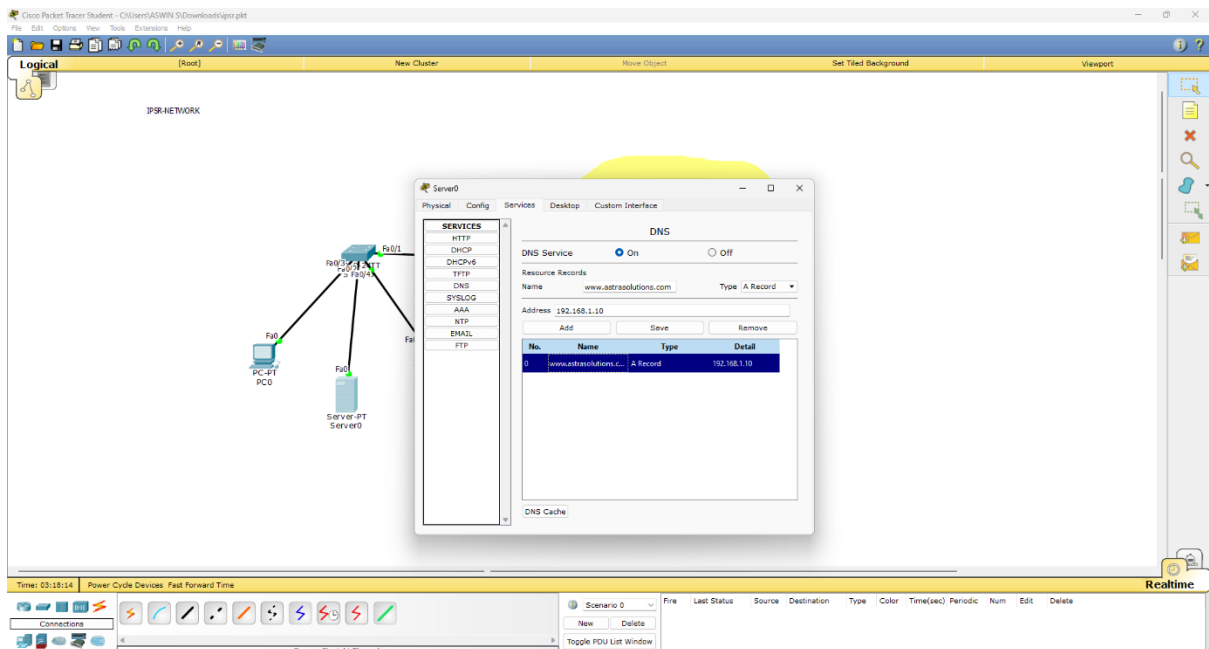

To enable access using a domain name, DNS service was configured.

Steps performed:

- Opened Server0 then Services then DNS
- Turned DNS service ON
- Added the following record:

Name - www.astrasolutions.com

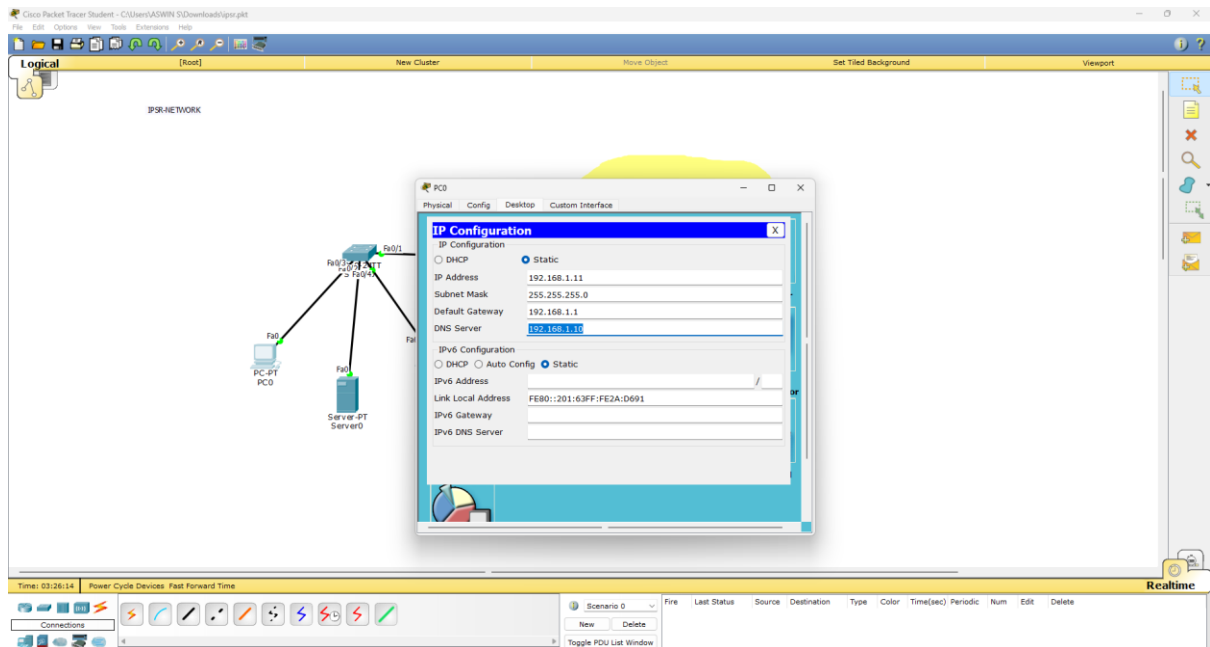

Address - 192.168.1.10

Client Configuration:

Each PC was configured with the DNS server address:

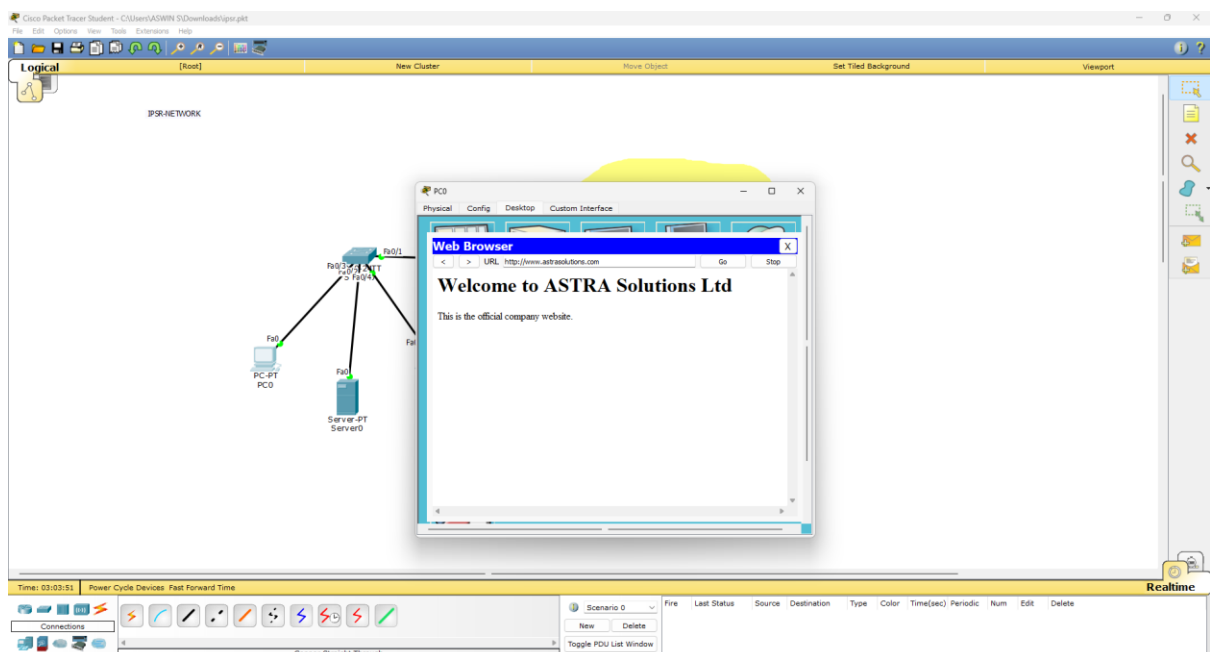

DNS Server: 192.168.1.10

Testing and Verification:

- Opened Web Browser on PC
- Entered: www.astrasolutions.com

The webpage was successfully loaded displaying the ASTRA Solutions website.

Conclusion:

This task demonstrated how to configure a web server and DNS service in Cisco Packet Tracer. By integrating HTTP and DNS services, users were able to access the website using a domain name instead of an IP address.
